

Mobile Control from SageQuest

Improve Routing and Communication with SageQuest's Garmin Integration

How often do your drivers need directions? Have late arrivals or late deliveries cost you customers or thrown off an entire day's schedule? Make your drivers' days easier and increase efficiency by integrating SageQuest's award-winning vehicle tracking with Garmin's user-friendly navigation devices.

Send Them on the Shortest Route

Remove guesswork and ensure the most efficient day for your drivers.

- Create a route in Mobile Control, then send it immediately to your drivers' Garmin device in the field.
- Your driver simply presses "Go" on the Garmin and the turn-by-turn directions begin.
- See a driver's current location and route status for the next planned destination on Mobile Control's real-time map.
- Automatically send directions through integrated applications such as workforce management solutions.

Simplify Communications

Our integration goes beyond simply sending directions. We have created a simple but powerful two-way messaging system to improve critical communication between the field and the office.

- Dispatchers create a message in Mobile Control and send it to one driver or broadcast the message to all Garmin devices.
- Drivers respond using simple response options (yes/no, OK) or type their own messages into the Garmin to reply.
- Drivers can also initiate a message from their Garmin to ask a question to the dispatch team.

Choose the Right Garmin for Your Fleet

Our integration works with several series of Garmin units. Visit the URL below to see a full list of compatible devices:
